**Playing the Oldies but the Goodies to Manage Patients with Treatment Resistant Hypertension**

Kristin Watson, Pharm D, BCPS-AQ  
Cardiology  
Associate Professor  
University of Maryland School of Pharmacy

UNIVERSITY of MARYLAND  
SCHOOL OF PHARMACY

**Definition**

- Uncontrolled:** blood pressure (BP) above goal and 3 or more treatment options, preferably a diuretic is included
- Controlled:** BP at goal with 4 or more medications

Hypertension 2011;57:1076-80; J Am Soc Hypertension 2014;8:743-57; Circulation 2016;133:e38-360

**Learning Objective**

- Discuss the place in therapy of spironolactone, hydralazine, clonidine and alpha-antagonists in the management of treatment resistant hypertension.
- Given a patient with treatment resistant hypertension, develop a pharmacological treatment regimen.

**Before you add another track...**

**Conduct a Thorough Assessment**

- Pseudoresistance
  - Adherence to medications
  - "White coat" phenomena
  - Drug-induced causes
- Obstructive sleep apnea
- Primary aldosteronism
- Renal artery stenosis
- Others: Cushing's syndrome, pheochromocytoma, aortic coarctation

Hypertension 2008;51:1403-19; J Am Soc Hypertension 2014;8:743-57

**The Who and The Why**

**At-Risk Groups**

- Increasing age\*
- Obesity\*
- Left ventricular hypertrophy
- Chronic kidney disease (CKD)
- Diabetes
- African American
- Female

**Pathophysiology**

- Normal cardiac output with:
  - ↑ systemic vascular resistance
  - ↑ plasma volume
- Degree of plasma aldosterone levels elevation and renin suppression

Hypertension 2008;51:1403-19; Drugs 2015;75:473-85

## Is a mineralocorticoid receptor antagonist the answer?

- Spironolactone as add-on therapy associated with significant BP reductions in several placebo-controlled trials

Drugs 2015;75:473-85; Hypertension 2011;57:1069-75; J Hypertension 2013;31:2094-102; Saudi J Kidney Dis Transplant 2011;22(1):75-8

## PATHWAY-2 Trial

- Spironolactone vs. bisoprolol, doxazosin and placebo (n=322)
- 230 received all four treatments; each "cycle" was 12 weeks
- Notable exclusion criteria:
  - Type 1 diabetes
  - estimated Glomerular Filtration Rate (eGFR) < 45 ml/min
  - Recent cardio/cerebrovascular event
  - Active cancer therapy
- Spironolactone associated with improved BP reduction compared to other therapies/placebo

*Take home point: spironolactone 25-50 mg/day as 4<sup>th</sup> agent for BP treatment in general population*

Lancet 2015; 386:2059-68

## Mineralocorticoid receptor antagonist: safety

- Hyperkalemia risk increased:
  - Diabetes
  - Renal disease
  - Advanced age
  - Concurrent non-steroidal anti-inflammatory agent use
- Start at lower dose when renal disease present
- Use in hemodialysis, Stage 3 or 4 CKD not well established

*Monitoring is KEY!!!*

Drugs 2015;75:473-85; Am J Nephrol 2009;30:418-24; J Am Coll Cardiol 2013;62:1585-93

## What else should we put on the B side?

- Direct renin inhibitor
- Mecamylamine
- Methyldopa
- Loop diuretic
- Minoxidil
- Beta-blocker
- Hydralazine
- Clonidine
- Alpha-antagonist

## Second line options?

### Aliskerin (Tekturna®)

- Should not be used in patients with diabetes or CKD receiving an angiotensin converting enzyme inhibitor/angiotensin receptor blocker

### Mecamylamine (Vecamyl®)

- Not for use in those with significant atherosclerosis
- Side effects heightened in those with renal disease
- Cumbersome regimen
- Sodium restriction *not* recommended

### Methyldopa

- Adverse effect profile
- Typically reserved for use during pregnancy

Tekturna® (aliskerin). Novartis. East Hanover, NJ 2015; Vecamyl® (mecamylamine). Turing Pharmaceuticals. New York, NY 2015; Methyldopa. Mylan Pharmaceuticals. Morgantown, WV 2015.

## Second line options?

### Loop diuretic

- Maybe necessary in those with advanced renal disease instead of a thiazide

- For volume overload

### Minoxidil

- Reflex tachycardia and other adverse effects
- Concomitant diuretic therapy (and often beta-blocker) required

### Beta-blocker

- Not as effective, as first line therapy, in reducing BP and clinical outcomes compared to other agents

- For use in those with compelling indications
  - Heart failure
  - Coronary disease
  - Arrhythmias

Am J Kidney Dis. 2004;43(5 Suppl 1):S1-290. Hypertension 2008;51:1403-19; J Am Coll Cardiol 2015;65:1998-038; JAMA 2003;289:2534-44

### Second line options?

<p><b>Hydralazine</b></p> <ul style="list-style-type: none"> <li>• Thrice daily</li> <li>• Adverse effect profile</li> </ul>	<p><b>Clonidine</b></p> <ul style="list-style-type: none"> <li>• Side effect profile limits use in the elderly</li> <li>• Transdermal patch available</li> </ul> <p><b>Alpha-antagonists</b></p> <ul style="list-style-type: none"> <li>• Male patient with benign prostatic hypertension</li> <li>• Orthostatic hypotension risk</li> </ul>
--	--

J Am Geriatr Soc 2015;63:2227-46; Hypertension 2008;51:1403-19

### What else should we put on the B side?

- Direct renin inhibitor
- Mecamylamine
- Methyldopa
- Loop diuretic
- Minoxidil
- Beta-blocker
- Hydralazine
- Clonidine
- Alpha-antagonist

### Non-Pharmacological Strategies

<p><b>Renal denervation</b></p> <ul style="list-style-type: none"> <li>• Initial trials encouraging</li> <li>• SYMPLICITY-HTN-3: large, prospective, randomized, controlled trial did not show benefit</li> <li>• PRAGUE-15: BP control similar to spironolactone; both in addition to standard medications</li> </ul>	<p><b>Others</b></p> <ul style="list-style-type: none"> <li>• Ultrasonic sound technology</li> <li>• Carotid baroreflex activation therapy</li> </ul>

--	---

CrCl = creatinine clearance

Maximize "A side" medications

↓

Assess for:

- Pseudoresistance
- Secondary causes

↓

- Mineralocorticoid receptor antagonist
- Utilize treatment options based on compelling indications

↓

- Add other "B side" medication(s)\*
- Refer to hypertension specialist

Evaluate and maximize lifestyle changes

**Treatment algorithm**

\* minoxidil and methyldopa last line; aliskerin increased side effects in combination with other RAAS inhibitors if diabetes/CKD; avoid mecamylamine

### More tracks on the way...

- Prevalence of Resistant Hypertension with Directed Observed Therapy (DOT)
  - DOT x 1 month followed by 24 hour ambulatory care BP monitoring
  - No adjustments in medication therapy
- Safety and Efficacy Study of LHWogo in Resistant Hypertension Patients
- Resistant Hypertension Optimal Treatment (ReHOT) Study
  - Traditional backbone 3 medication regimen
  - Spironolactone vs. clonidine x 3 months
- TRIUMPH Study
  - Exercise training, sodium and calorie reduction, and weight management compared to physician advice and standard education
